HIV—Risk Assessments

1. Risk Assessments for HIV
   a. Clinical Risk Assessment
   b. Drug Use Risk Assessment
   c. Sexual Risk Assessment

2. Reference

3. Risk Assessment & Blood Draw Form

This guideline is designed for general use for most adult patients, but may need to be adapted to meet the special needs of a specific patient as determined by the patient's provider.
1. **Risk Assessments for HIV**

HIV risk assessments should be incorporated into regular medical care of all clients, done on a regular basis, and with every new patient. Sexual and drug use risks should be determined. See sample Risk Assessment & Blood Draw form (Section 2 below) or refer to: STD/HIV Risk Assessment, A Quick Reference Guide developed by the Seattle STD/HIV Prevention Training Center at: www.uchsc.edu/mpaetc for further guidance.

**Sexual and drug use risks should be determined. Key questions include:**

- a. Have you ever had a blood transfusion or received any other kind of blood product? Was it before 1985?
- b. Do you now or have you ever shared injection equipment?
- c. Are you now or have you ever been sexually active?

**a. Clinical Risk Assessment:**

- o Include STDs and HIV in the differential diagnosis.
- o Assess all patients for signs or symptoms consistent with an STD including:
  - Genital ulcers, warts, blisters or other lesions
  - Pain or burning with urination
  - New or unusual skin rash
  - Oral lesions

For men:
- Urethral discharge
- Testicular or groin pain

For women:
- Increased bloody or foul-smelling vaginal discharge
- Vulvar itching
- Metamenorrhagia (bleeding between periods)

- o Assess for constitutional signs, history of chronic infection, and associated problems:
  - Headaches
  - Diarrhea
  - Fatigue
  - Shingles
  - History of STD, hepatitis, or TB
  - Fever, chills, night sweats
  - Skin lesions/rash
  - Weight loss
  - Oral thrush
  - Generalized lymphadenopathy
b. Drug use risk assessment

- It is important to be non-judgmental and non-moralistic. Injection drug use is illegal and many patients will not be truthful unless trust is established.

- Start with less threatening questions:
  - What over-the-counter or prescription medications are you taking?
  - How often do you use alcohol? Tobacco?
  - Have you ever used drugs from a non-medical source?
  - Have you ever injected any kind of drug?
  
- Do not assume anything.
  - Drug use occurs in all socioeconomic strata.
  - Don’t forget that people also inject things like insulin and steroids.
  - Any sharing of injection equipment, even one time, can result in HIV exposure.

- Look for other clues in the history and physical.
  - Antisocial behavior
  - Recurrent criminal arrests
  - Needle tracks

- If there is a positive history of drug injection use, get more information:
  - Do/did you share needles/other equipment?
  - Is/was the equipment you use(d) clean?
  - How did you know it was clean?
  - What drugs did you inject?

c. Sexual Risk Assessment:

- Use specific terms:
  - Use “men who have sex with men” or “women who have sex with women” instead of gay. (Some men do not consider themselves “gay” if they practice anal insertive intercourse, but their receptive partners may consider themselves to be gay.)

- Do not assume anything.
  - Marriage does not always mean an individual is monogamous or heterosexual.
  - People who identify as homosexual may also have heterosexual sex and vice versa.
o Ask for an explanation of sexual practices:
  ▪ When you say you had sex, what exactly do you mean?
  ▪ I don't know what you mean, could you explain...?

o Direct and non-judgmental questions are best:
  ▪ Do you have sex with men, women or both?
  ▪ Do you have oral sex? Vaginal sex? Anal sex?
  ▪ What do you know about the sexual activities of your partners?
  ▪ What do you do to protect yourself during sex?
  ▪ When was the last time you had unprotected sex?
  ▪ Do you use condoms? How often?
  ▪ Have you ever had sex with someone you didn't know or just met?
  ▪ Have you noticed any STD-type symptoms in your partner(s)?
