ICSI 2017 Algorithm for the Diagnosis and Treatment of Osteoporosis  
***For Screening and Treatment Guideline Algorithm for Postmenopausal Women, see **Appendix Figure 1***

This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider.
This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider.
Lifestyle Modification Recommendations for Bone Health Maintenance

1. **Adequate Calcium Intake** recommended in all patients of both genders (Appendix Table 2)
   a. Dietary intake preferable but supplementation often needed to accomplish goals
   b. Daily recommendations of calcium: (NIH)
      i. Women 19-50 years, Men 19-70 years: 1000 mg/day
      ii. Women ≥51 and Men >70: 1200 mg/day
2. **Adequate Vitamin D Intake** and treatment of vitamin D deficiency (Appendix Table 2)
   a. Daily recommendations for vitamin D
      i. Adults <50: 400-800 IU daily
      ii. Adults ≥50: 800-1000 IU daily (NOF)
   b. Maintain serum 25-hydroxyvitamin D (25[OH]D) level to ≥30 ng/ml
      i. Treat with 50,000 IU once weekly for 8-12 weeks, follow with maintenance dose of 1500-2000 IU daily
      ii. Many will need more than general recommendations of vitamin D
      iii. High prevalence of deficiency in limited sun exposure, dark skin, and obese individuals
3. **Physical Activity** recommended lifelong for all ages (ICSI)
   a. Regular weight-based and muscle-strengthening exercise reduces risk of falls and fractures by improving agility, strength, posture, and balance
   b. May modestly increase bone density
4. Achieve and maintain normal BMI of 20-25 kg/m² (ICSI)
5. **Fall Prevention**
   a. Home safety assessment and modification
   b. Gradual withdrawal of psychotropic medication, if possible
   c. Correction of visual impairments
   d. Consider hip protectors in those with high risk of falling
6. **Cessation of tobacco** use and **avoidance of excessive alcohol** intake
   a. Tobacco use detrimental to skeleton and overall health; address cessation at every visit (ICSI)
   b. Excess alcohol may be detrimental to bone health and increases fall risk (NOF): limit alcohol use to no more than 1 drink/day for women, no more than 2 drinks/day for men (ICSI)
7. Treat/Modify secondary causes (other disease processes or medications) of osteoporosis whenever possible (see Table 3 and 4)

Recommendations for Baseline Bone Mineral Density Screening (Central DEXA) - See Appendix Table 5
Assess fracture risk with the Fracture Risk Assessment Tool (FRAX) during initial evaluation for osteoporosis. Bone mineral density testing (BMD) by central dual-energy X-ray absorptiometry (DEXA) is recommended for:
1. All postmenopausal women aged ≥65 years
2. Men aged ≥70 years, shared decision making (ICSI, NOF)
3. Women <65 years whose fracture risk is ≥9.3% from FRAX analysis or are considered to be at fracture risk (NOF, USPSTF) (also list by ICSI of risk factors)
4. Post-menopausal women of any age with additional risk factors for osteoporosis or fracture
   a. Family history of osteoporosis with fractures (mother or sister)
   b. Weight <127 pounds or 58 kg or BMI <20 (ICSI)
   c. Alcoholism
   d. Current tobacco smoking
   e. History of premature menopause (prior to age 45)
   f. Frailty/high likelihood of falls
   g. Excessive caffeine intake
   h. Gonadal hormone deficiency
   i. Immobilization and inadequate activity
   j. Low calcium or vitamin D intake
   k. White or Asian race
5. Men aged 50-69 based on risk factor profile (NOF; but evidence is insufficient to access benefit/harm (USPSTF, See Table 5)

This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider
6. Adults (both women and men) who have a fracture (NOF) without major trauma (low-impact/fragility fracture)

7. Adults with significant acquired kyphosis and/or historical height loss >4 cm or measured height loss greater than 2 cm should have lateral vertebral assessment with DEXA or thoracic and lumbar spine radiographs and bone density testing (ICSI)

8. Consider in patients with fractures who are willing to accept treatment

9. Patients undergoing organ transplantation – recommend baseline BMD test at entrance to transplantation program, follow-up yearly prior to transplant (or every 6-12 months if on high-dose steroids), then yearly after transplant (ICSI)

10. May be recommended with exogenous (oral) glucocorticoid (ICSI) therapy (past, present, or ongoing) equivalent to prednisone 5 mg/day or more for 3 months. DEXA may be done at initiation of treatment if greater than 3-month course is anticipated.

11. May be recommended if peripheral screening is abnormal or inconclusive.

12. May be recommended medical conditions and medications associated with an increased risk of osteoporosis in adults (Appendix Tables 3 and 4)

**Diagnosis via DEXA Scan Interpretation**

Diagnosis is obtained by DEXA measurement of bone density at hip and lumbar spine. The resulting T-scores measure the number of standard deviations from the mean level for a young adult population. In pre-menopausal women and men <50 years, an ethnic or race-adjusted Z-score should be used for diagnosis. Diagnosis and decision to treat is further clarified by calculation of the FRAX score. (ICSI)

FRAX®: [www.NOF.org](http://www.NOF.org) and [www.shef.ac.uk/FRAX](http://www.shef.ac.uk/FRAX)

DEXA scores:

1. Normal: T-score ≥ -1.0, Z-score > -2.0
2. Low bone mass (osteopenia): T-score between -1 and -2.5
   i. Use FRAX to determine if treatment is indicated
3. Osteoporosis: T-score ≤ -2.5

In some patients it is reasonable to make a presumptive diagnosis and start treating despite absence of BMD assessment (ICSI)

**Recommendations for Repeat Bone Mineral Density Scanning (Central DEXA)**

Repeat DEXA scanning should ideally be performed at same testing center as original scan to improve accuracy of data. The frequency will depend upon the clinical situation. Generally repeat DEXA should be done no more than every 12-24 months (ICSI), may consider more often in steroid-treated patients or other high-risk individuals.

1. Baseline T scores > -1.0, no new risk factors: repeat in 5 - 10 years.
2. Baseline T scores < -1.0, not on therapy, with ongoing risk factors: repeat in 2-4 years.
3. Baseline T scores < -1.5, monitoring therapy: repeat in 5 years. (ACP)
4. Aggressive disease progression suspected, based on clinical situation: may repeat in 6-12 months, but this should be fairly uncommon.

**Recommendations for Initiation of Therapy (Appendix Table 4)**

Postmenopausal women and men age 50 and older presenting with the following should be considered for treatment:

1. A hip or vertebral (clinical or morphometric) fracture (fragility fracture)
2. T-score ≤ -2.5 at the femoral neck, lumbar spine (anteroposterior), or hip after appropriate evaluation to exclude secondary causes
3. Low bone mass: T-score between -1.0 and -2.5 at the femoral neck or spine and a 10-year probability of a hip fracture > 3% OR a 10-year probability of a major osteoporosis-related fracture ≥20% based on the US-adapted WHO absolute fracture risk model (FRAX)
   FRAX®: [www.NOF.org](http://www.NOF.org) and [www.shef.ac.uk/FRAX](http://www.shef.ac.uk/FRAX)
4. Steroid use at supra-physiologic doses anticipated for > 3 months duration
5. Consider all men and postmenopausal women with low-impact (fragility fractures) as potential candidates for pharmacologic intervention, even without bone density testing

This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider

This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider.
deprivation therapy and women receiving adjunctive aromatase inhibitor therapy for breast cancer, and at high risk for fracture Must correct hypocalcemia and vitD deficiency prior to initiation

agent to maintain BMD

- URI
- Fatigue

Serious:
- Endocarditis
- Cellulitis
- Dermatitis
- Hypocalcemia
- Anaphylaxis
- Aseptic necrosis of the jaw (rare)
- Atypical femoral fracture
- Cancer

### Anabolic Agents: Parathyroid Hormone (PTH)

**Teriparatide (Forteo)**

| Place in therapy: | Typically reserved for (women) with severe osteoporosis or who have had fractures (NOF) Generally not first line because lack of data on all fracture types (ACP) Studied in both men and postmenopausal women for treatment of osteoporosis and glucocorticoid-induced osteoporosis Increase of bone mass in men with primary or hypogonadal osteoporosis at high risk for fracture | 20mcg SubQ daily for not more than 2 years *Not to be used for more than 2 years *When stopped, bone loss is rapid; use another agent to maintain BMD | Vert: +++ Non-vert: +++ Hip: N/A BLACK BOXED WARNING: Show to cause an increase in the incidence of osteosarcoma in male and female rats, dependent on dose and duration of treatment. • Orthostatic hypotension • Nausea • Increase in serum calcium • May increase risk of digoxin toxicity • Increase in urinary calcium • Arthralgia • Pain • Leg cramps

- Hypersensitivity
- Avoid in patients with increased risk of osteosarcoma (including Paget's disease, prior radiation, unexplained elevation of alkaline phosphatase, or in patients with open epiphyses)
- Do not use in patients with a history of skeletal metastases, hyperparathyroidism or pre-existing hypercalcemia
- Not for use in patients with metabolic bone disease other than osteoporosis.
- Should not be administered to pregnant or breastfeeding women

### Medications for SELECT Patient Populations

**Selective Estrogen Receptor Modulator (SERM) Raloxifene**

Approved for prevention and treatment of postmenopausal osteoporosis Option for women with an elevated risk of breast cancer

Vert: Non-vert: - Hip: - BLACK BOXED WARNING: Risk of deep vein thrombosis and pulmonary embolism Common:
- Hot sweats
- Leg Cramp

Serious:
- VTE
- Cerebrovascular accident

Thromboembolism

- History of venous thromboembolism
- Pregnant or nursing women

**Female Menopausal Hormone Therapy: Estrogen +/- Progestin**

NOT recommended first line in management or prevention of osteoporosis For women at significant risk who cannot take non-estrogen therapies

Strength and doses vary BLACK BOXED WARNING: Endometrial cancer, Cardiovascular disease, Breast Cancer, Dementia

Reactions depend on dose formulation
- Cerebrovascular accident, edema, hypertension, MI, PE

- Undiagnosed abnormal genital bleeding
- DVT or PE (current or history)
- Active or recent arterial thromboembolic disease (stroke, MI)
- Carcinoma of breast
- Estrogen-dependent tumor
- Hepatic dysfunction or disease
- Pregnancy

---

This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner's provider
This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider.
Duration of Treatments

1. No pharmacologic treatment should be considered indefinite; duration decisions need to be individualized. (NOF)

2. Assuming renal function remains adequate, recommended bisphosphonate therapy duration is
   a. 5 years on alendronate in moderate-risk patients
   b. 6-10 years on alendronate in higher-risk patients
   c. 3 annual doses of IV zoledronic acid in moderate-risk patients
   d. 6 annual doses in higher-risk patients on IV zoledronic acid
   e. Benefits of bisphosphonates may continue after discontinuation (NOOG, NOF)
   f. May use teriparatide or denosumab during the “bisphosphonate holiday” period for higher-risk patients

3. Treatment with teriparatide should be limited to 2 years
   a. After stopping treatment, bone loss is rapid; treatment should be switched to another agent (NOF)

4. After stopping treatment with denosumab, bone loss is rapid (NOF)
   a. Ensure patient is dedicated to therapy and adherence
   b. Consider switching to another agent after discontinuation as bone loss is rapid

Appendix
This guideline is designed for general use for most patients but may need to be adapted to meet the special needs of a specific customer-owner as determined by the customer-owner’s provider.
**Table 2: Common Sources of Calcium and Vitamin D**

*ALL patients should be encouraged to get adequate amounts of calcium and vitamin D first and foremost from their diet, and supplement only what is needed.*

<table>
<thead>

**Common Supplements available at ANMC**

| Calcium carbonate 1250 mg (Oscal) | 500 mg elemental calcium per tab |
| Combination Calcium and vitamin D (Oyster Shell Calcium with Vitamin D) | 500 mg elemental calcium plus 200 International Units vitamin D per tab |
| Vitamin D3 (cholecalciferal) | 1,000 IU tablet |
| Vitamin D3 (cholecalcinferal) | 5,000 IU capsule |
| Vitamin D2 (ergocalciferal) | 50,000 IU capsule |

**Example:** One tablet of Oyster shell Calcium with Vitamin D BID would provide 1000 mg calcium plus 400 IU vitamin D, appropriate for those who consume very little dairy or other calcium-rich food. One tablet daily would be appropriate for a person consuming two calcium-rich foods/day.

**Table 3: Medications Associated with an Increased Risk of Osteoporosis in Adults**

- Aluminum
- Anticonvulsants
- Aromatase inhibitors
- Barbiturates
- Caffeine (in excess)
- Chemotherapeutic drugs
- Cyclosporine A
- Diuretics causing hypercalcemia
- Glucocorticosteroids ≥ 5mg/day of prednisone or equivalent for ≥3 months
- Gonadotropin-releasing hormone agonists
- Heparin (long-term)
- Lithium
- Methotrexate
- Phenytoin derivatives
- Pioglitazone and rosiglitazone
- Proton Pump Inhibitors
- Provera depo (chronic)
- SSRIs
- Tacrolimus
- Tamoxifen (premenopausal)
- Thyroid hormone (supratherapeutic)
- Tenofovir
- Tetracycline (extended use)
- Total Parenteral Nutrition
- Vitamin A (excess)
- Warfarin (long term)
