## PROBLEM: Hypertensive Disorders in Pregnancy

Chronic HTN	
Definition: Mild: SBP ≥140-159 mm Hg, DBP ≥ 90-109 mm Hg	Severe: SBP ≥160 mm Hg DBP ≥110 mm Hg
Use of anti-HTN medications before pregnancy	Onset of HTN before the 20 <sup>th</sup> week of gestation and persists 42 days postpart.
<u>Medications</u>	
ASA 65-85 mg po once a day after 12 - 36 weeks GA	<u>Labs</u> : Baseline – Cr, CBC, LFTs, spot total P/Cr ratio
Stop Anti-hypertensives initially and recheck BP in one wk	Second line Try
☐ If BP 160 / 105 mm Hg, then start Labetolol 200-2400 mg orally in two or three divided doses	Second line Tx: Alpha-methldopa 250-3000 mg orally in two or three divided doses
Nifedipine 30 to 120 mg qd as sustained release tablet	Avoid ACE Inhibitors
<u>Ultrasound</u>	<u>Monitoring</u>
□ 18-20 weeks	☐ Kick counts
□ 28-32 weeks, then every 4 weeks	At 36 weeks start testing with NST/AF weekly (except below)
December 1 to 1 t	☐ If FGR increase NST to twice a week, weekly Dopplers
Prenatal visits: Every 4 weeks until 32 weeks, then every 2 weeks Delivery: No meds 39 wks / Controlled on meds 39 wks / Difficu	
	IL CONTION ST WAS - AISO 2X NOT WITH WEEKLY AT OTICE DX U
Pre-eclampsia	a a 10 minute reat (Panaet in 4 hours to confirm dv)
Definition: SBP ≥ 140 mm Hg or DBP ≥ 90 mmHg, upright followin Total P/Cr > 0.3, or >300 mg of protein in a 24 hour urir	
After 20 wks EGA	ic specimen, or it on anne dipolick
Can convert from GHTN without proteinuria if develops	severe features
If Total P/C is 0.15 - 0.29, then obtain 24 urine PROT	
Monitoring	<u>Labs</u> :
☐ Kick counts	□ Baseline – CBC, Cr, AST/ALT
NST 2x/wk and AF q week	☐ PLt ct, Cr, LFTs q wk
□ U/S every 3-4 weeks □ If FGR, then add Doppler q wk	
II I GK, then add boppier q wk	
Prenatal visits: weekly and check BP twice a week	
<u>Delivery</u> : 37 weeks	
Pre-eclampsia with severe features	
<u>Definition</u> : SBP ≥ 160 mmHg or DBP ≥ 110 mmHg on 2 occasions	
Total P/Cr ≥ 0.3, or ≥300 mg of protein in a 24 hour urin	
Can convert from GHTN without proteinuria if develops <u>Severe Features</u>	severe reatures
Cerebral or visual changes	BP > 160/110
Pulmonary edema	Creat > 1.1 or 2 x pt's normal Creat
LFTs 2x normal	Thrombocytopenia, platelets <100,000
Plan: Admit for Delivery. Magnesium sulfate in active labor with ca	
If < 34 weeks start steroids –see Guideline for details.	Low dose ASA with subsequent pregnancies 12-36 weeks
Chronic HTN with superimposed Pre-eclampsia	
Management for pre-eclampsia as outlined above	
Delivery: 37 weeks for superimposed pre-eclampsia	
If severe features < 34 weeks start steroids –see Guideline fo	or details
	- Gerane.
Gestational HTN	
Gestational HTN  Definition: BP > 140/90 without proteinuria after 20 weeks	
Definition: BP > 140/90 without proteinuria after 20 weeks	
	elops severe features
Definition: BP ≥ 140/90 without proteinuria after 20 weeks HTN does not persist beyond 12 weeks postpartum Can convert to preeclampsia without proteinuria if deve Labs: Baseline – Cr, LFTs, CBC, Total P/Cr ratio	
Definition: BP ≥ 140/90 without proteinuria after 20 weeks HTN does not persist beyond 12 weeks postpartum Can convert to preeclampsia without proteinuria if deve Labs: Baseline – Cr, LFTs, CBC, Total P/Cr ratio Management: Same as preeclampsia without severe features, exc
