

# ANMC *Clostridium difficile* Infection (CDI) Prophylaxis Guideline

## Risk Factors

<u>Host</u>	<u>Disruption in flora</u>
<ul style="list-style-type: none"> <li>Recent hospitalization or known contact in the community</li> <li>Immunocompromised</li> <li>Female gender</li> <li>Age &gt; 65 yo</li> </ul>	<ul style="list-style-type: none"> <li>Prior antibiotics in previous 90 days</li> <li>PPI/H2 Blocker use (Risk of causing <i>C.difficile</i>: PPI&gt;H2 Blockers&gt;Antacids)</li> <li>Antineoplastic use in the past 8 weeks</li> <li>Loss of intestinal function           <ul style="list-style-type: none"> <li>Ileus/obstruction</li> </ul> </li> <li>Recent procedures           <ul style="list-style-type: none"> <li>Enema/NG Tube/Surgical Procedure</li> </ul> </li> </ul>

## High Risk Antimicrobials

<ul style="list-style-type: none"> <li><b>3<sup>rd</sup>/4<sup>th</sup>/5<sup>th</sup> generation cephalosporins</b> <ul style="list-style-type: none"> <li>Ceftazidime</li> <li>Cefdinir</li> <li>Ceftriaxone</li> <li>Cefpodoxime</li> <li>Cefepime</li> <li>Ceftaroline</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li><b>Clindamycin</b></li> <li><b>Beta-Lactam/Beta-Lactamase Inhibitors</b> <ul style="list-style-type: none"> <li>Piperacillin/Tazobactam</li> <li>Ampicillin/Sulbactam</li> <li>Amoxicillin/Clavulanic acid</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li><b>Fluoroquinolones</b> <ul style="list-style-type: none"> <li>Levofloxacin</li> <li>Ciprofloxacin</li> <li>Moxifloxacin</li> </ul> </li> <li><b>Carbapenems</b> <ul style="list-style-type: none"> <li>Ertapenem</li> <li>Meropenem</li> </ul> </li> </ul>
---	--	--

## Initial Management

- Antimicrobial therapy should be narrowed when possible and treatment should be for the shortest duration clinically necessary
- Discontinue PPIs, H2 Blockers, and antacids if no ongoing indication
  - Exclusion: GI bleed, *H.pylori* infection, gastric/duodenal ulcer, erosive esophagitis, chronic NSAID/steroid use (>20 mg/day prednisone equivalent)

## Probiotic Exclusion Criteria

<ul style="list-style-type: none"> <li><i>Neutropenic</i></li> <li><i>HIV positive w/ CD4 &lt;200</i></li> <li><i>Active malignancy undergoing chemotherapy or radiation</i></li> <li><i>Pancreatitis</i></li> </ul>	<ul style="list-style-type: none"> <li><i>Transplant patient on immunosuppressant therapy</i></li> <li><i>Prosthetic heart valve</i></li> <li><i>Ileus, GI obstruction</i></li> </ul>
--	---

## High Risk Patients

Criteria	Prophylactic Regimen	Duration
Initiating “high risk” antimicrobial therapy	<ul style="list-style-type: none"> <li><b>Lactobacillus rhamnosus GG 1 capsule PO</b> daily, initiated at time of antimicrobial therapy initiation</li> </ul>	<ul style="list-style-type: none"> <li>Continue 7 days after cessation of antimicrobial therapy</li> </ul>
C.diff within last 6 months <b>and</b> initiating “high risk” antimicrobial therapy	<p><b>Adults Only:</b></p> <ul style="list-style-type: none"> <li><b>Vancomycin 125 mg PO BID</b> (prophylaxis dosing)* <b>PLUS</b></li> <li><b>Lactobacillus rhamnosus GG 1 capsule PO</b> daily at time of antimicrobial therapy initiation</li> </ul>	<ul style="list-style-type: none"> <li>Vancomycin during antimicrobial therapy</li> <li>Lactobacillus: continue 7 days after cessation of antimicrobial</li> </ul>

## Considerations

- If ongoing therapy with *C. difficile* predisposing antimicrobial regimen, upon completion of 10-14 days of QID dosing for treatment, may continue enteral vancomycin BID until completion of therapy.
- \*Clinical trials utilizing secondary prophylaxis with oral vancomycin were done in the inpatient population
